SUBCELLULAR LOCATION: Integral membrane protein.

LOCALIZED IN ENDOSOMAL VESICLE MEMBRANE (PROBABLE).

LOCALIZED IN ENDOSOMAL VESICLE MEMBRANE (PROBABLE).

DOMAIN: CONTAINS A HISTIDINE-RICH REGION WHICH IS A LIGAND ZINC AND AN ASPARTIC ACID-RICH REGION WHICH IS A POTENTIAL FOR ZINC (BY SIMILARITY).

SIMILARITY: BELONGS TO THE CATION DIFFUSION FACILITATOR FANTRANSPORTERS (CDF, TC 2.A.4). SLC30A SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Genet. 17:292-297(1997).

It may contribute to zinc homeostasis at low concentrations of zinc (By similarity).

SUBCELLULAR LOCATION: Integral membrane protein (Potential).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 49
                                                                                                                                                                        FUNCTION: Involved in zinc efflux across the cytoplasmic menthus reducing zinc accumulation in the cytoplasm and renderbacteria more resistant to zinc. It may contribute to zinc homeostasis at low concentrations of zinc (By similarity). SUBCELLULAR LOCATION: Integral membrane protein (Potential) SIMILARITY: BELONGS TO THE CATION DIFFUSION FACILITATOR FAM. TRANSPORTERS (CDF, TC 2.A.4). SLC30A SUBFAMILY.

Grass G., Fan B., Rosen B.P., Franke S., Nies D.H., Rensing C.;

"21tB (YbgR), a member of the cation diffusion facilitator family, is
an additional zinc transporter in Escherichia coli.";
J. Bacteriol. 183:4664-4667(2001).

-i. FUNCTION: Involved in zinc efflux across the cytoplasmic membrane,
thus reducing zinc accumulation in the cytoplasm and rendering
bacteria more resistant to zinc. It may contribute to zinc
homeostasis at low concentrations of zinc, whereas zntA is
required for growth at more toxic concentrations.

-i. SUBCELULAR LOCATION: Integral membrane protein (Potential).

-i. INDUCTION: By zinc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Yano M., Horluch ...

The FUNCTION: Involved in zinc efflux across the cytoplasmic membrane, thus reducing zinc accumulation in the cytoplasm and rendering bacteria more resistant to zinc. It may contribute to zinc homeostasis at low concentrations of zinc (By similarity).
